/compatible sites of a custom modified MCS of the pBluescript (K6+) vector. The library was normalized in 2 rounds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-923 and Bonaldo et al., Genome Research 6 (1996): 791, except that a significantly longer reannealing hybridization was used."

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Description

GRNERAL INFORMATION:
GRNERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ABSUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A
CURRENT FILING DATE: 1999-02-18
PRIOR PLILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-02-18
PRIOR FILING DATE: 1998-07-27

i Sequence 595, Application US/09621976
j Patent No. 663963
i GENERAL INFORMATION:
APPLICANT: Dumas Milne Edwards, J.B.
APPLICANT: Glordano, J.Y.
TITLE OF INVENTION: ESTS and Encoded Human Proteins.
FILE REFERENCE: GENSET.054PR2
CURRENT APPLICATION NUMBER: US/09/621,976
i CURRENT FILING DATE: 2000-07-21
i SOFTWARE: Patent.pm
SEQ ID NOS: 19335
i LENGTH: 374
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  374

UT-E-ENG is a subtracted CDNA library constructed
according to Bonaldo, Lennon and Soares, Genome Research,
6:791-806, 1996. First strand cDNA synthesis was primed
with an oligo-dT primer containing a Not I site. Double
stranded cDNA was ligated to an ECOR I adaptor, digested
with Not I, and cloned directionally into pT/T3-Pac
vector. The oligonacleotide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail. The
sequence tags for this library are: fetal eyes,
AGARTCAAGA; lens, CGATTAGCGA; eye anterior segment,
AGARTCAACA; lens, CGATTAGCGA; eye anterior segment,
AGARTCAACA; lens, CATTAGCGA; et ina,
Foveal and Macular, GTCC; RPE and Choroid, ACCTA. This
library was created for the program, Gene Discovery in the

/clone lib="CoR1; Site= 2: Not1; This normalized library was Site= 1: ECOR1; million independent clones. cDNA synthesis was initiated using an oligo(dT) primer, using methylated Cron in the first strand synthesis reaction.
Following this first strand reaction, double-stranded cDNA was blunted, ligated to NotI adapters, digested with ECOR1; size-selected, and cloned into the NotI and ECOR1 compatible sites of a custom modified MCS of the pBluescript (KS+) vector. The library was normalized in 2 rounds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6 (1996): 791, except that a significantly longer reannealing hybridization was used."

//constructed_from 1 million independent clones. cDNA
synthesis was initiated using an oligo (dT) primer, using
methylated C in the first strand reaction, double-stranded cDNA
was blunted, ligated to NotI adapters, digested with
ECORI, size-selected, and cloned into the NoII and ECORI
compatible sites of a custom modified MCS of the
pBluescript (KS+) vector. The library was normalized in 2
rounds using conditions adapted from Soarse set al., PNAS
(1996): 791, except that a significantly longer
reannealing hybridization was used."

/note="Organ: trunks; Vector: pBluescript II KS(+);
Site_l: ECORI; Site_2: Not1; This normalized library was constructed from 1 million independent clones. cDNA synthesis was initiated using an oligo(dT) primer, using methylated C in the first strand synthesis reaction. Following this first strand reaction, double-stranded cDNA was blunted, ligated to Not1 adapters, digested with ECORI size-selected, and cloned into the Not1 and ECORI comparible sites of a custom modified MCS of the pBluescript (KS+) vector. The library was normalized in 2 rounds using conditions adapted from Soares et al., PNAS (1994) 91: 9228-9232 and Bonaldo et al., Genome Research 6

polylinker; Site 1: Not I; Site 2: Eco RI; UI-R-EPO is a
subtracted cDNA library constructed according to Bonaldo,
Icanon and Soares, Genome Research, 6:791-806, 1996. First
Icanon and Soares, Genome Research, 6:791-806, 1996. First
strand cDNA synthesis was primed with an oligo-dr primer
containing a Not I site. Double stranded cDNA was ligated
to an EcoR I adaptor, digested with Not I, and cloned
directionally into pr773-Pac vector. The oligonucleotide
directionally into pr773-Pac vector. The oligonucleotide
used to prime the synthesis of first-strand cDNA contains
a library tag sequence that is located between the Not I
site and the (dT)18 tail. The sequence tags for this
library are: distal colon, GAAGTCCTCC; osteoblast,
AAGARARCAA, cell line R3327 5A, GGACTAGATC; cell line
R3327 5P, CACGTGAGAT; duodenum, TGTGGTTCAT; prostate,

The present invention relates to new NOVX polypeptides. The invention is useful for treating or preventing a NOVX-associated disorder such as cardiomyopathy or atherosclerosis, where the disorder is related to cell signal processing and metabolic pathway modulation in a subject, preferably human. The invention is also useful for treating metabolic disorders (e.g. obesity), diabetes, infectious disease, neurodegenerative disorders (e.g. Alzheimer's disease, Parkinson's disease), immune disorders, haematopoletic disorders and various cancers. The molecules of the invention are also useful for treating or preventing cirrhosis, che invention are also useful for treating or preventing cirrhosis, concentitis, learning and memory defects, infertility, congenital heart pancreatitis, learning and memory defects, infertility, congenital heart ceptratory disease, gastro-intestinal diseases, reproductive, health, respiratory disease, bone marrow transplantation, endocrine diseases, alleray and inflammation, nephrological disorders, urinary system disorders, neuropsychiatric disorders and age-related disorders. The consents inclease is the sequence represents a NOVX gene. This sequence

```

```
proteins and coding sequences are useful for treating or preventing NOV-associated disorders or in the manufacture of a medicament for treating the disorders, such as cancer, heart disease, inflammation, autoimmune disorders, allergies, blood disorders, ALDS, diabetes, obesity, asthma, 19A nephropathy, cirrhosis, arthritis, Alzheimer's disease, infections (e.g. bacterial, viral, parasitic), stroke, muscular dystrophy, epilepsy and other wasting disorders associated with chronic diseases. NOVI is a TEN-M4 like protein and the NOVI gene is localised to chromosome 11

New human proteins associated with cell growth, differentiation death, useful for diagnosing, treating or preventing autoimmune inflammatory disorders (e.g. AIDS, allergy or anemia), cancer, atherosclerosis or hepatitis.

Claim 5; Page 175-178; 181pp; English.

The invention relates to an isolated polypeptide comprising GBDD1-12 (cell growth, differentiation and death), a naturally occurring amino caid sequence at least 90% identical to GCDD, a biologically active fragment or an immunogenic fragment. Also included are the comprising a promoter sequence operably linked to the GGD oplynucleotides encoding GGDD1-12, a recombinant polynucleotide an anticody, soreming for compounds which bind to/modulate or are polynucleotides, a cell transformed with the recombinant polynucleotide, a transgenic organism comprising the recombinant polynucleotide, an anticody, soreming for compounds which bind to/modulate or are at the appropriates of GGDD polynucleotide and a naticody, soreming for compounds which bind to/modulate or are compounds antibody, soreming for compounds which bind to/modulate or are compounds antibody, soreming for compounds which bind to/modulate or are antibodies of GGDD polynucleotides, polynucleotide microarray. The polypeptides, polynucleotides of GGDD polynucleotides of GGDD polynucleotides antagonists are useful for diagnosing, treating or preventing disorders are useful for diagnosing, treating or preventing disorders associated with aberrant expression of GGDD, vera, psoriasis, paroxysmal nocturnal haemoglobinuria, polycythaemia disorders (e.g. renal tubular acidosis, anaemia or mental rectardation) contrological disorders (e.g. Alzheimer disease, Parkinson's disease or the menstrual cycle), or autoimmune/inflammatory disorders (e.g. AlbS, contact dermatitis, Crom's disease, diabetes mallitus, contact dermatitis, Crom's disease, diabetes mallitus, cycleoporosis, pancreatiis, pancreatiis, pancreatiis, pancreatiis, pancreatiis, pancreatiis, pancreatiis, fungal, parasitic, protects of cargines or viral, bacterial, fungal, parasitic, protects of contact dermatitis, fungal, parasitic, protects of cargines or proteins associated with cgdDc. The present sequence on codes

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78329-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, itssue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or activit/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding polypeptides with cytokine-like activities, useful in diagnosis and gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, hamunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthitis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52881), 2111 (AAK52882) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication

The present invention relates to methods of detecting a prostate cancerassociated transcript in a cell from a patient. The method comprises contexting a biological sample from the patient with prostate cancerassociated polymucleotides (designated PC genes) that selectively thyridise to a sequence that is at least 80% identical to them. The prostate cancerassociated polymucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer or associated genes are useful for diagnosing or treating prostate cancer or segents that in the prostate cancer or associated genes are useful for diagnosing or treating prostate cancer or associated genes are useful for diagnosing or treating prostate cancer or inhibit prostate cancer. The nucleic acid sequences are particularly useful in gene therapy, as a vaccine or in antisense applications.

                                                                                                                                                                                                                                                                                                                                                                                                                    Ota T,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score:
The present invention describes primer sets for synthesising 5602 full-
cc [a, an oligo-dr primer and an oligonucleotide complementary to the
cc (a) an oligo-dr primer and an oligonucleotide complementary to the
cc (a) an oligo-dr primer and an oligonucleotide which comprises one of the 5602
cc omplementary strand of a polynucleotide which comprises one of the 5602
cc onplementary strand of a polynucleotide with complementary to the
cc omplementary strand of a polynucleotide which comprising a sequence complementary to the
cc omplementary strand of a polynucleotide which comprising a sequence complementary to a
complementary strand of a polynucleotide which comprising a sequence complementary to the
cc onigonucleotide comprises a 3' end sequence, where the
coligonucleotide comprises a 1 least 15 nucleotides and the combination of
the 5'-end sequence/3'-end sequence; selected from those defined in the
specification. The primer sets can be used in antisense therapy and in
cspecification. The primer sets can be used in antisense therapy and in
cpection and/or diagnosis of the shormality of the proteins encoded by
the full-length cDNAs. The primers are also useful for the
connas easily without any specialised methods. AAH13628 and
cc halsons assally without any specialised methods. AAH13628 to AAH13628
coligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
